Automating Data Import and Relationship Mapping Using Import Sets & Dot Walking

Abstract

This project focuses on automating the process of importing employee data into the system and mapping relationships using Import Sets and Dot Walking. It reduces manual work and ensures accurate data linking, especially for displaying manager details automatically in incident forms.

Introduction

Many organizations manually enter employee data, which leads to errors and time consumption. Also, linking employee details like manager information is difficult.

Objectives:
- Automate employee data import
- Reduce manual errors
- Automatically display manager details
- Improve data consistency

Literature Review

Existing systems use manual data entry or basic import methods without proper relationship mapping. Some tools support data import, but they lack automation in linking related fields like manager email.

Methodology

Used Import Sets to upload employee data. Created Transform Maps to map fields. Applied Dot Walking to access related data (manager email). Configured system to auto-fetch manager details in forms.

Implementation

Imported employee data (Name, Email, Department, Manager). Mapped data into target tables. Implemented Dot Walking to fetch manager email. Configured Incident form to display manager email automatically.

Results

Data imported successfully without errors. Manager email displayed automatically. Reduced manual work. Improved accuracy and efficiency.

Conclusion

The project successfully automated data import and relationship mapping. It improved system efficiency and ensured correct linking of employee and manager details.

Future Scope

Add real-time data sync. Integrate with external HR systems. Improve UI for better user experience. Add validation for error handling.
